

Rp_framework_vs_wordpress

SI	RP Framework	Wordpress CMS
1	It is a CMS as well as application development framework. Best for website / web applications that involves too much customisation.	It is basically a CMS. Ideal for known type of website/applications with available theme and plugins. It is not ideal for custom application.
2	Clear separation of business, application and display logic	It is the same
3	It is a custom CMS. Codes are open RP customers only.	Open source CMS and codes are open to all including hackers.
4	The basic web developments modules are available but number of ready modules are limited.	A lot of free and paid 3rd party plugins are available, so initial development time is less if done using available theme and plugins.
5	Highly secure and not prone to security hacks. No upgrade trap.	Prone to security attack if not upgraded regularly
6	Minimum cost to develop a custom module	Double or more cost to develop a custom module
7	No maintenance issue (for any future change and addition) as all the modules are developed by RP itself. No compatibility issue.	Maintenance can be an issue. Core Version upgrade can cause compatibility problem with an existing 3rd party plugin. Also any sort of logic changes may not be possible.
8	Ideal for any making any custom website, web application that may require future modifications or additions	Not right for custom website or web application that may need future modifications. Website revamp cost may exceed new development cost.
9	Right for website that requires maintenance. Even a simple website will need some work work and so the cost.	Right for information website or ready made websites that does not requires modification other than text/image changes.
